The secret of safe sex: the control of meiotic recombination

Abstract

Recombination-mediated linking of homologous chromosomes is a hallmark of meiosis that enables the halving of chromosomal ploidy in sexual life cycles. Meiotic recombination is initiated by programmed DNA double-strand breaks (DSBs) generated by the type II topoisomerase-related SPO11 enzyme. The meiotic chromosomal axes exerts critical control over SPO11 activity and recombination, which is essential for germline genome integrity. I will present our recent discoveries of chromosome axis-linked mechanisms that control recombination initiation, ensuring efficient pairing of homologous chromosomes while preventing excessive DNA damage to the germline genome.

Viernes 10 Mayo 2024

Hora: 12:00 pm

Lugar: Salón de actos del IBFG
